Colour	Master's "Belief"	Hardware Meaning
Dark Green	High-Fidelity Success	The master has either probed this node (back dot) and it's alive, or its neighbours are so healthy that the algorithm is 90%+ sure that this node has energy
Yellow/Cream	Maximum Uncertainty	The master has no data here and no nearby probes to infer from. This is where the search usually moves next.
Orange/Red	Low-Fidelity Information	The master has either probed here and got a "no-show" (white dot), or it has inferred from a nearby failure that this area is energy-starved.
